## DETAILED ACTION

### ***Examiner's Statement of Reasons for Allowance***

1. The following is an examiner's statement of reasons for allowance: The prior art fails to disclose or make obvious the independent claims 1 and 42 which claim a drum type washing machine comprising: a tub of plastic having a wall portion for holding water and securing a driving unit thereto, and a front side sloped upward at a predetermined angle from the ground; a drum rotatably mounted in the tub; a hollow drum shaft passed through the tub, and connected to the drum inside of the tub for transmission of driving power from a motor to the drum; a least one bearing from supporting the hollow drum shaft; a stator fixedly secured to the rear wall portion of the tub; a rotor connected to a rear end of the drum shaft to constitute a motor together with the stator; a pulsator rotatably mounted in the drum; a pulsator shaft mounted to pass through the hollow of the drum shaft having a fore end connected to the pulsator; and a pulsator control means for braking/releasing rotation of the pulsator including: a pulley positioned in rear of the rotor connected to a rear end of the pulsator shaft for controlling rotation of the pulsator, and a braking device for controlling rotation of the pulsator in the drum by braking/releasing the pulley. The prior art fails to disclose or make obvious the independent claim 43 which claims a method for controlling a tilted drum type washing machine, in which rotation of a pulsator in a drum is controlled by braking/releasing a pulsator rotation control pulley, comprising the steps of: performing washing in a state

the pulsator is held; and performing washing in a state the pulsator is released to rotate freely.

The closest prior art is that of European Patent Application EP 1,386,995 to Oae et al. Oae et al. teaches a washing machine which may be of the drum type with a tub wherein the tub has a wall portion for holding washing water and a securing a drive unit thereto and a front side sloped upward at a predetermined angle from the ground; with a housing and front and rear suspension rods; a pulsator which one of ordinary skill realizes is rotatably mounted within the tub; a driving mechanism for the pulsator with dehydration shaft wherein said shaft is hollow, passed through the tub, and realized by one of ordinary skill to be connected to the drum inside of the tub for transmission of driving power from a motor to the drum; pulsator shaft mounted to pass through the hollow of the drum shaft having a fore end connected to the pulsator; a clutch for transmitting the power from the motor to the pulsator and drum/tub. Oae et al. does not teach a pulsator control means for braking/releasing rotation of the pulsator including: a pulley positioned in rear of the rotor connected to a rear end of the pulsator shaft for controlling rotation of the pulsator, and a braking device for controlling rotation of the pulsator in the drum by braking/releasing the pulley. Furthermore Oae et al. does not teach that the pulsator may be rotated without the aid of a clutch to engage the motor with the pulsator.

The advantages of the current invention over the prior art are quite clear: the prior art teaches a brake that acts on the motor causing the pulsator and drum to declutch from each other while the current invention does not use a clutch to spin the

pulsator, therefore the current invention does not require a clutch in order to agitate the clothing wherein the use of a clutch may require servicing or said clutch may potentially break thereby adding to the costs of the washing machine and decreasing reliability. Furthermore, in the current invention, the rotation of the drum causes rotation of the pulsator through the movement of the laundry, thereby providing for a gentle agitating action as opposed to the prior art wherein the clutch directly couples the pulsator to the drum wherein said action may damage clothing that is not suitable for a harsh agitation. Finally, the rotation or stopping of the clutch is directly acted upon by a braking mechanism wherein the prior art indirectly couples the pulsator to the drum through a clutch, thereby the current invention creates a simplicity of design that may lead to longer service life, increased reliability, and decreased costs over the course of service.

Since independent claims 1, 42, and 43 are allowed, dependent claims 3-24, 26-41 and 44-45 are also allowed.
